

Turn coursework into a plan you can adjust

Planned workflow

Student choice Optional feedback, game and task rewards.
Private progress stays out of shared reports.

Nicholas Dunzelman and Caleb Brooks

September 28, 2026 Advisor: Dr. David Luginbuhl

Nicholas's sharing and privacy proof

Generated outputs	Reported privacy result
PDF report + Word (DOCX) file Instructor email preview (unsent)	Included: course, work and due date Excluded: private progress, experience points (XP), game data

Nicholas's contributions and M1 status

All seven M1 task areas complete

Area	Nicholas's contribution
Collaboration tools	GitHub (code), Docs/Slides (documents), Slack (chat), Linear (tasks)
Documents	Requirements half; workflow/UI/export Design half
Test Plan	10 cases written: workflows, exports, privacy, reminders and progress

Requirements: behavior, interface and response time.

Design: system layout, module connections and screen sketches.

26 planned cases: Caleb 13 + Nicholas 10 + game/reward 3; execution later.

Advisor review · September 21

Tool tests and sleep/fitness-style game ideas discussed.

No game-direction change confirmed.

Selected stack for a local Python app

Single-user · Streamlit → Python services → SQLite · not yet integrated

Tool	Job	Why it fits
Streamlit + Python	Screens and planning logic	One Python codebase
Python csv + SQLite	Validate CSV; save accepted rows	Small files; schema + queries
fpdf2 + python-docx	Create PDF and Word files	Simple report formats
Python email tools	Prepare an unsent email preview	No credentials for this proof
Minimax + alpha-beta	Look ahead; prune needless search	Small 3×3 search space
Playwright	Browser checks; M1 PDF proof	Exercises real user workflows

PDF: fpdf2 selected; M1 proof used Playwright.

Rewards: priority/difficulty points + streak bonus.

Caleb's prototype results

Reported September 23 · small proofs before app integration

Task	Observed result	Why it matters
CSV → SQLite coursework import	2 valid records saved 1 invalid row + 1 duplicate flagged	CSV validation + SQLite storage
Cross-plan scheduling	Overlapping times detected Both tasks kept	Conflict detection; student chooses changes
Optional game (tic-tac-toe)	Invalid moves rejected Computer play, result + new game	Move validation; results + new-game state

Other contributions

Tool comparison; Requirements half; architecture/data/game Design half
13 test cases written: data, schedules, rewards, privacy and response time

September 23 demo report: prototype observations, not full acceptance-test results.

Milestone 2: October 26

Next: implement, test and demonstrate coursework + planning

1. Coursework

Enter and validate

Manual or CSV-file entry
Schedules, assessments,
deadlines and scores

Store records

Save validated
coursework

Choose work

Select an assignment, test
or other coursework

2. Planning and instructor feedback

Build plan

Template of tasks,
editable by the student

➤ Combine tasks

Daily/weekly tasks
across active plans

➤ Prepare to share

PDF + Word export;
unsent email preview

➤ Revise plan

Enter instructor advice;
accept, reject or adapt

Proposed split, pending team confirmation

Caleb: import, storage, schedules. Nicholas: selection, plans, sharing, revision.
