MILESTONE 2

Folio

Folio helps students turn coursework editable study plans

Milestone 2 connects coursework entry, saved plans and selected sharing

Daily and weekly schedules show when tasks from active plans overlap

Nicholas Dunzelman and Caleb Brooks
Advisor: David Luginbuhl

Milestone 2 tasks

M2 task	Done	ND	CB	To do
Coursework interface	100%	100%	0%	None
Validation and CSV import	100%	0%	100%	None
Plans and revision	100%	100%	0%	None
Academic storage	100%	0%	100%	None
Selected sharing	100%	100%	0%	None
Combined schedule / integration	100%	100%	0%	None

ND = Nicholas Dunzelman
CB = Caleb Brooks

Requirements and design

Workflow and privacy

Students use separate screens to enter coursework, edit plans, view schedules and share details.

Changes stay in a draft until the student chooses Save plan.

Students choose the academic details to export. Private student information stays out.

Data and validation

The app checks coursework before saving it and explains errors in imported rows.

A local database keeps saved coursework, plans and task times so they can be reopened.

The schedule identifies both tasks when times overlap. Students choose the correction.

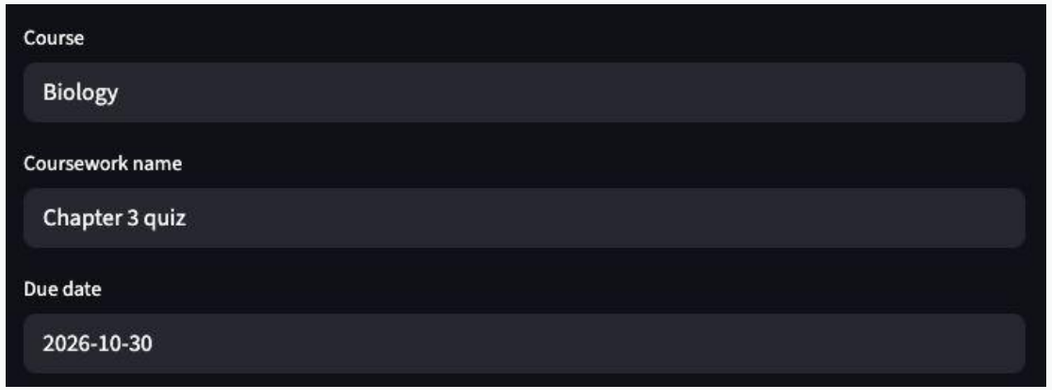

Coursework → editable plan

Coursework

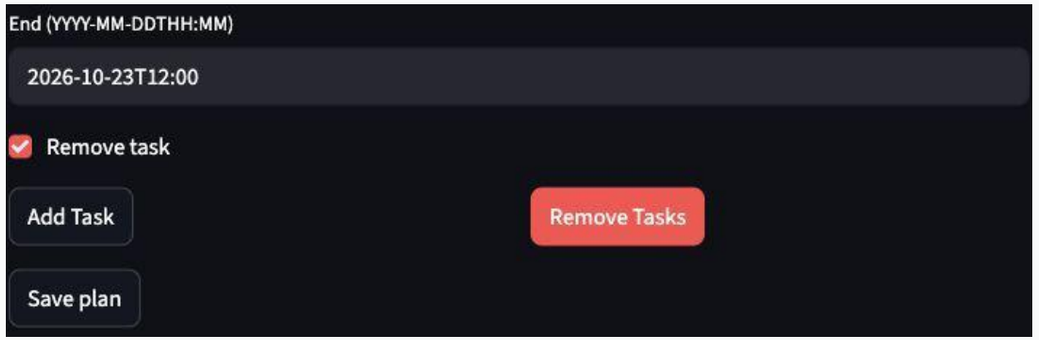

Enter an assignment and its due date. Select that coursework when creating a study plan.

Plan

A template creates a starting set of tasks. Students can add, remove or edit tasks before saving the plan.

Coursework and due date

Add, remove, edit and save tasks

During integration, we added missing class-time fields and fixed a gap in checking task times.

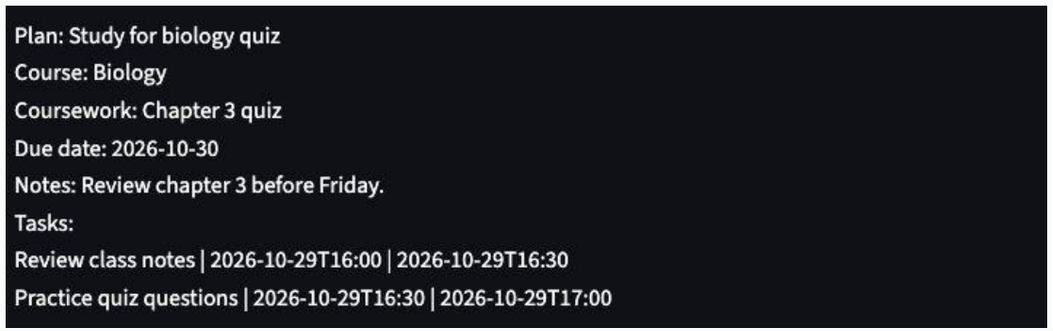

Sharing and instructor feedback

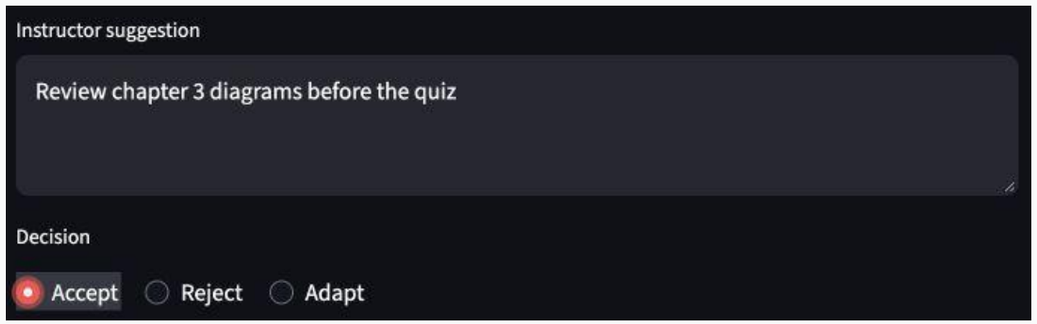

Share selected academic details

Choose which plan details to share. Export a PDF or Word file, or prepare an email to review and send yourself.

Keep control of advice

If an instructor suggests a task-name change, accept it, edit it or keep the original. Review the plan before saving.

Only selected academic details

Accept, reject or adapt

We checked that each export matches the selected preview and excludes private information.

M2 test plans

Plan revisions: check that edited tasks and feedback choices are restored when a saved plan is reopened.

Data and scheduling: check that valid imported rows are kept, saved data survives a restart, and overlapping task times are identified.

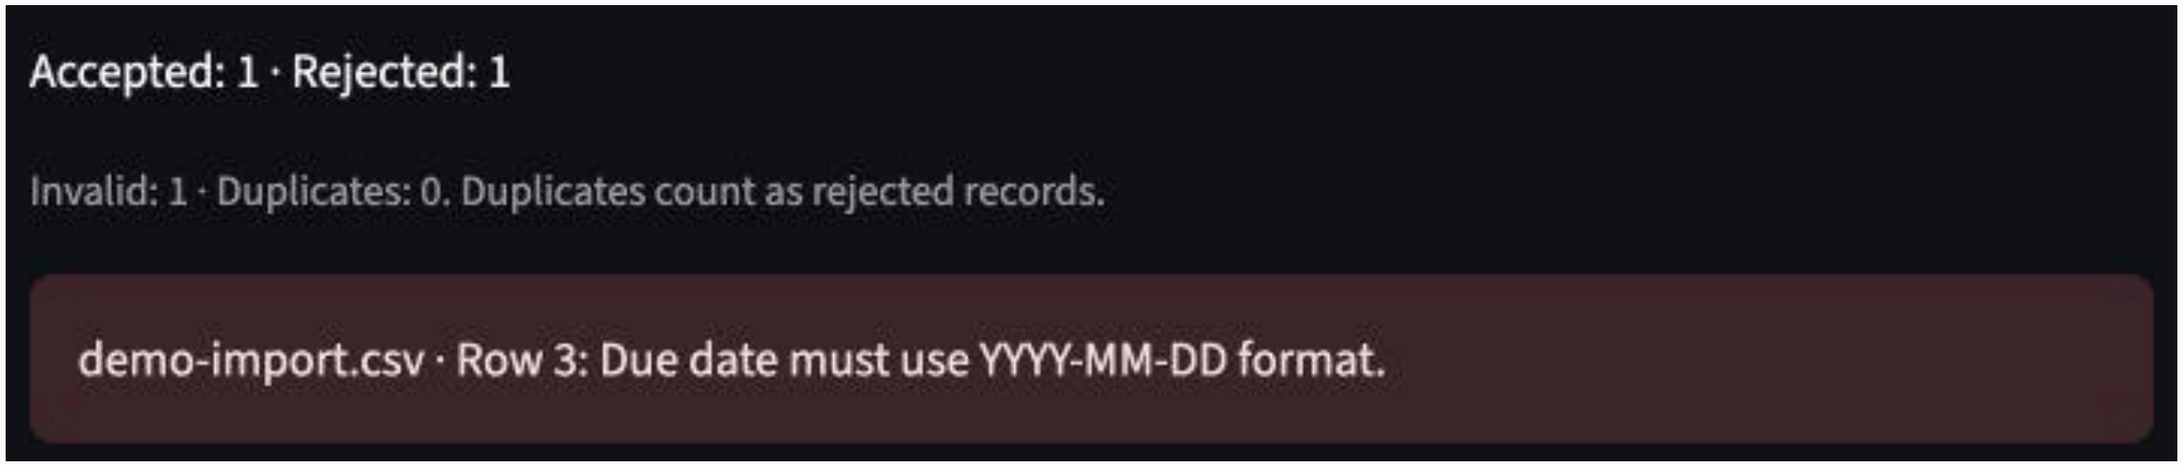

Selected exports: check that PDF, Word and email outputs include only the chosen academic details and exclude private information.

These written plans describe expected behavior. The automated test results appear later.

CSV import with clear validation

A CSV file stores spreadsheet rows as plain text. The app checks each row before saving it.

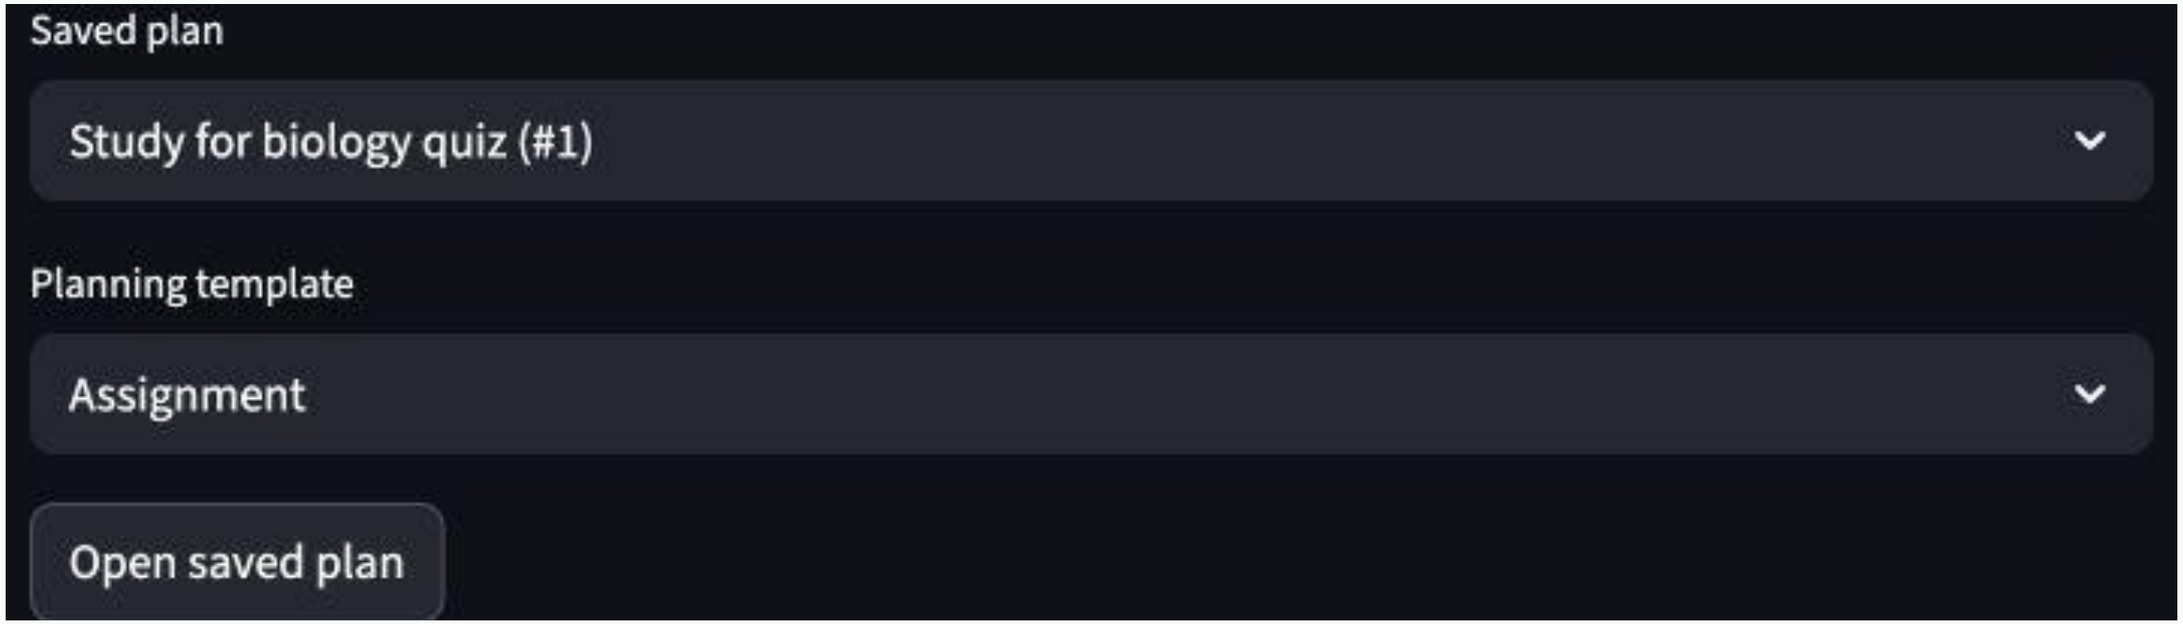

This example keeps one valid row and rejects another because its date is invalid.

Saved plans, ready to reopen

A local database saves coursework and plans on the computer.

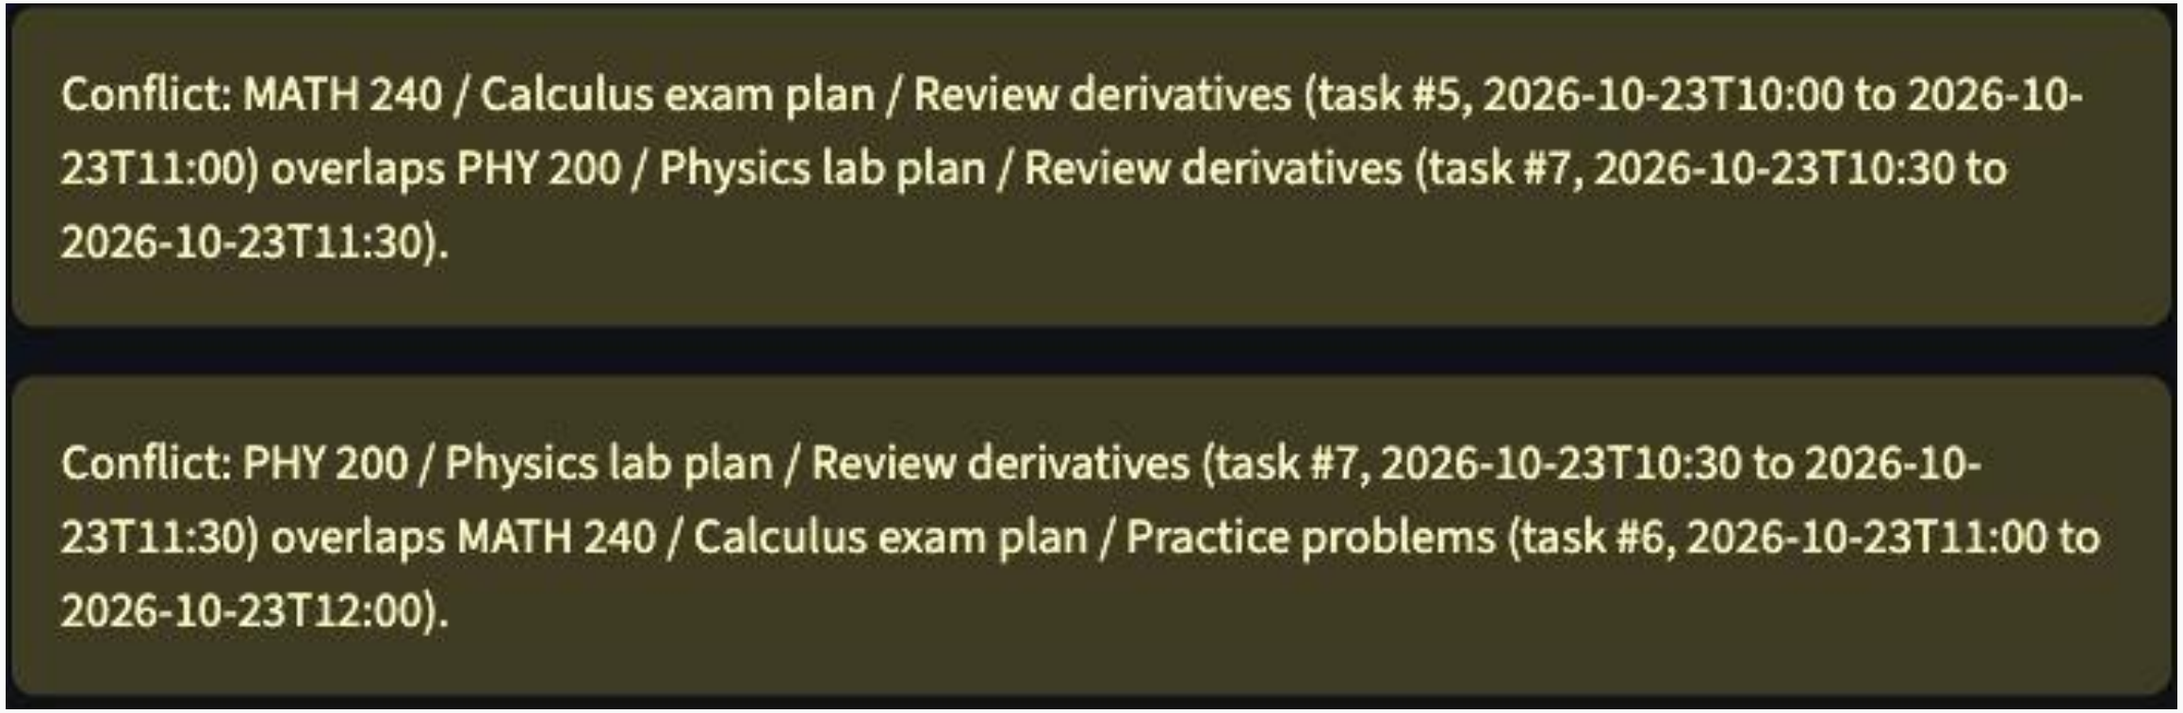

Students can reopen a saved plan and continue editing. Restart checks confirmed the saved information was restored.

Conflicts across active plans

Daily and weekly schedules bring together tasks from active plans.

When tasks overlap, the app shows both names and times so the student can choose a correction.

Checks confirmed that invalid or overlapping corrections do not change the saved plan.

Verified M2 results

167

automated tests passed

All 91 application tests and 76 preserved demo tests passed. The integrated workflow checks passed too.

In three browser tests, each import saved 500 records in under five seconds. Stored contents were checked.

Opening a saved plan and saving with conflict notices each took under two seconds in three trials.

Checks also covered overlap boundaries, edits, deletion, restart recovery and private information in exports.

These timings describe the tested local examples, not a guarantee for every computer.

M3 tasks: reminders and progress

Task and deliverable	Nicholas	Caleb
A. Task views and reminders Students set reminders in daily/weekly views. Settings are saved and restored. Reminders work while the app runs.	Reminder controls Error messages	Saved settings Reminder behavior
B. Completion and progress Students mark tasks complete to see plan progress. Completion must not count twice and must survive a restart.	Completion UI Progress display Congratulations	Avoid double-counting Correct totals Restart checks

Milestone 3 is due November 23, 2026.

M3 tasks: gamification and integration

Task and deliverable	Nicholas	Caleb
C. Gamification planning Choose how the game will work, then define its rules, rewards and tests. Students can plan without using the game.	Interaction design Reward feedback	Compare options Rules and rewards
D. Complete version 1 Test the complete workflow, including privacy, saved data and timing. Review results together and fix failures.	Workflow checks Privacy checks User checks	Data tests Timing tests Design review

Milestone 3 is due November 23, 2026. We have not selected the game or reward design yet.

Advisor review

OCT 23

We reviewed the app slides with Dr. Luginbuhl on October 23.

He returned the signed evaluation on October 26. We discussed making the coursework view easier to use.

He considered schedule progress sufficient. Those views had not been reviewed in detail, so we will discuss them next meeting.

Advisor: Dr. David Luginbuhl
